Project 2

Project 2 asks us to create an interactive physical computing system where we incorporate two input devices and two output devices. Using the skills we have developed thus far, we must create a well-developed experience.

For my project, I created a sensor with an RGB Blink that would alternate between Red, Green, and Blue when you move your hand over the sensor. I also included a button that when pressed, would play music so you could have your own mini-rave.
